Lower the quantity to reduce the generation of nonspecific PCR products. Poor integrity: Degraded DNA may appear as smears or lead to high background in gel electrophoresis. Minimize shearing and nicking of DNA during isolation. Evaluate the integrity of the template DNA prior to PCR by gel electrophoresis, if necessary.

Summary — PCR Troubleshooting Checklist. Check quality of sample (degraded material will cause erroneous results). Check RT protocol is compatible with design (e.g., an Oligo-dT primed RT must have a qPCR assay in the 3' - 1 kb of sequence). Check assay design. Check all controls. Check primers using SYBR green I dye/run a gel.

PCR conditions. Denaturation time should be kept to a minimum to decrease depurination events. Use touchdown PCR; start at a higher annealing temperature and reduce by two degrees per cycle for several cycles. Design primers with melting temperatures (T_m) above 68 ° C. PCR polymerases. We offer several PCR polymerases optimized for long-range PCR.
